

ELECTROSMOG

Every electrical device, which we use or is in use in our environment, produces some form of electric magnetic radiation. Imagine: computers, TVs, miles of wiring in cars and homes, alarm clocks, stereos and cell phones, each with its own range, pattern and intensity of effect. ELECTROSMOG is the constant smog of low-level electromagnetic radiation (EMR) which all humans now live and sleep in. Because it is invisible to us, how much and what effects this combination of radiations has on our lives and functioning is not

given a lot of conscious attention by most. Nonetheless, there have been thousands of studies and experiments completed by concerned scientists and researchers which strongly link exposure to electromagnetic radiation to the immunity and nerve disorders and cancers which are, today, unfortunately, epidemic.

Awareness and information about this issue are the first steps in bettering the situation. Individuals who choose to limit their unnecessary exposure to EMR and who choose safer working distances between themselves and the electric devices they use daily (two feet from computer monitors, using headsets for cell phones, for instance) increase their well-being. Protective measures, in the form of shielding and the generation of helpful fields which negate the effects of harmful EMR as much as possible, are truly essential to our wellness.

House regulator installed on fuse box

EVDAN Regulators

The Evdan regulator has been developed by remarkable German inventors and craftspeople. It is their intention for you to eliminate most negative energy and information fields harmful to your quality of life and to reduce the days of illness of all workers in every factory/industrial, malls, public entertainment sites and personal home.

Handy Regulator for personal use

Germanium (a semi-metallic element important in semi-conductors and in gamma and subtle radiation detection) and Ruby, the super-hard gem used in lasers are the key elements of these devices. Radiation reaches the germanium, which works with the other components in the regulator as an antenna. The negative oscillation particles pass to the ruby, which sends the out-of-phase information back, which sufficiently weakens the original frequencies. The regulator works in the same way as the predecessor to Laser technology, MASERS, do. It scans electromagnetic sources for harmonic waves and then generates harmonic wave interference in

phases, which greatly reduces the effect of the electromagnetic radiation. The EVDAN technology is very similar in effect to the new sound canceling technology for head phones.

EAV tests of The Evdan regulator have repeatedly shown elimination of up to 90 percent of the negative fields produced by an automobile's electric motors and catalyzers.
